The name which,

#### Common or Greek Tortoise (*Tortuosa graeca*).

when standing alone, is now generally restricted to the family of reptiles *Tortuoidae*, or land *tortuosa*, or with a qualifying term is applied to the *Emys*, the *Testudo* or freshwater *tortuosa*, and the *Trionyx*, the mud *tortuosa*, or soft *tortuosa*. The name was formerly applied to all the members of the order *Chelonis*, which includes the *Chelonis*, a salt-water family but the reptiles of this section are now usually called *tortuosa*. (See *TORTUOSA TORTUOSA*.) The distinctive features of the *tortuosa* and other *chelonis* consist in the modification of the skeleton and of the skin structure or scales so form the well known bony box in which their bodies are incased. Thus the spinal elements of the back, together with the associated and united ribs, form the carapace or back, whilst the sides of the box are formed by marginal plates, which by some zoologists are regarded as representing the ossified and modified cartilages of the ribs and by others as membrane bones developed by the skin. The plastron or lower part of the bony case is formed by nine pieces, as to the nature of which naturalists also disagree, some considering it merely as a greatly modified sternum or breast bone, and others as composed of membrane bones developed like the marginal plates by the skin. The *Tortuoidae* (the typical land *tortuosa*) have short stunted limbs adapted for terrestrial progression, the short toes are bound together by the skin, and have well developed nails. The carapace is strongly convex, and is covered by horny

epidermic plates. The horny jaws are unprotected and adapted for cutting or may be divided into serrated processes. The head, limbs, and tail can be completely retracted within the carapace. Though capable of swimming, the *tortuosa* proper are really terrestrial animals, and are strictly vegetable feeders. The most familiar example is the common Greek or European *tortuosa* (*Tortuosa graeca*) so frequently kept as a household pet, and which occurs chiefly on the eastern borders of the *Mediterranean*. These animals sometimes live to a great age (over 100 years according to some), and hibernate through the colder season of the year. They attain a length of 18 inches. A much larger species is the great Indian *tortuosa* (*T. gallica*), which inhabits in great numbers the *Bay of Bengal* and *Odagava Islands*, and attains a length of over 8 feet, and a weight of 800 lbs. Its flesh is reckoned food of excellent quality, as are also its eggs.

The box *tortuosa* of India and Madagascar (*Chelonis areolata*) is remarkable for the curious development of the front part of the plastron which shuts over the anterior aperture of the shell like a lid when the animal retracts itself. The box *tortuosa* of North America (*Chelonis carolina*), in which the hinder part of the plastron forms a lid, is included among the *Emys* or *tortuosa*, as is also the lettered *tortuosa* (*Chelonis scripta*) belonging to the same continent, and is named from the curious markings of its shell—2. *Mitt.* A defence used by the *antelope*, formed by the troops arranging themselves in close order and placing their backs over their heads, making a cover resembling a *tortuosa*-shell, a *tortuosa* (which was).

**Tortuosa-bottle** (tor'tō-shēl or tor'tō-shēl), *n.* A member of an extensive family of *oligoneurina* insects (*Campididae*), living upon plants, and so called from their eyes projecting over the body somewhat like the carapace of a *tortuosa*. It is a native of the Cape of Good Hope, and is occasionally found in greenhouses in Britain.

**Tortuosa-shell** (tor'tō-shēl or tor'tō-shēl), *n.* A name popularly applied to the shell or rather the carapace or scales of the *tortuosa* and other allied *chelonis*, especially to the shell of the *Chelonis imbricata* (the hawt-hill *tortuosa*), a species which inhabits tropical seas. The horny scales or plates which form the covering of this animal are extensively used in the manufacture of combs, chess boxes, &c., and in laying and other ornamental work. It becomes very plastic when heated, and when cold retains with sharpness any form it may be moulded to in its heated state. Plaster can also be worked together under the pressure of hot steam. The quality of *tortuosa*-shell depends mainly on the thickness and size of the scales, and to a smaller degree upon the cleanness and brilliancy of the colours. The

Hawt-hill or Tortuosa-shell Turtle (*Chelonis imbricata*).

best *tortuosa*-shell is that of the Indian Archipelago. It is now largely and successfully imitated by horn, and artificial com-

2. A political party name first used in England about 1679, and applied originally as an epithet of reproach to all who were supposed to be abettors of the imaginary Popish Plot; and then generally to those who refused to concur in excluding a Roman Catholic prince (in the particular instance James II.) from the throne. The nickname, like its contemporaneous opposite *Whig*, in coming into popular use became much less strict in its application, until at last it came simply to signify an adherent of that political party in the state who disapproved of change in the ancient constitution, and who supported the claims and authority of the king, church, and aristocracy, while their opponents, the Whigs, were in favour of more or less radical changes, and supported the claims of the democracy. In modern times the term has to some extent been supplanted by *Conservative*, and the Conservative may be considered as the modern representative of the ancient Tory. See *CONSERVATIVE*.

It is curious how often political parties have ended by assuming to themselves the first place, and on them by their adversaries in reproach and scorn.

*Tories* was a name properly belonging to the Irish bogtrotters, who during our Civil War robbed and plundered, professing to be in arms for the maintenance of the royal cause, and from them transferred about the year 1680 to those who sought to maintain the extreme prerogatives of the Crown. *Trench.*

7. The act or business of exchanging commodities for other commodities or for money; the business of buying and selling; dealing by way of sale or exchange; commerce; traffic. Trade comprehends every species of exchange or dealing, either in the produce of land, in manufactures, in bills or money. It is, however, chiefly used to denote the barter or purchase and sale of goods, wares, and merchandise, either by wholesale or retail. Trade is either *foreign* or *domestic* or *inland*. *Foreign trade* consists in the exportation and importation of goods, or the exchange of the commodities of different countries. *Domestic* or *home trade* is the exchange or buying and selling of goods within a country. Trade is also *wholesale*, that is, by the package or in large quantities, or it is by *retail*, or in small parcels. —**Board of trade**, a department of the British government having very wide and important functions respecting the trade and navigation of the kingdom. It is a permanent committee of the privy-council, and is presided over by a member of the cabinet. It is divided into six departments, each having its separate staff: (a) the *commercial department*, whose duties are to advise the treasury and the colonial and foreign offices on matters relating to tariffs and burdens on trade, to superintend the business under the acts relating to the registration of designs, copyright of designs, art-unions, industrial exhibitions, &c. Included within this department are the standard weights and measures office. (c) The *railway department*, which has the supervision of railways and railway companies, and which must be supplied with notices of application for railway acts, and with plans, before the relative bill can be brought before parliament. Before a line is opened for traffic the permission of the board on the report of an inspector must be got; and on the occurrence of an accident notice must be sent to the department, which is then empowered to take any measures it may deem necessary for public safety or interest. It has also to keep a register of joint-stock companies, of the accounts of insurance companies, and to prepare provisional orders relating to gas, water, and tramway companies. As accessories these unions may collect funds for benefit societies, insurance of tools, libraries, and reading-rooms; but their fund, to which every member must regularly contribute a stated sum, is principally reserved for enabling the men to resist, by strikes and otherwise, such action on the part of the employers as would tend to lower the rate of wages or lengthen the hours of labour.

**Trade-wind** (trád'wind), *n.* [That is, wind blowing in a regular *trade* or course.] One of those perpetual or constant winds which occur in all open seas on both sides of the equator, and to the distance of about 30° north and south of it. On the north of the equator their direction is from the north-east (varying at times a point or two of the compass either way); on the south of the equator they proceed from the south-east. The origin of the trade-winds is this:—The great heat of the torrid zone rarefies and makes lighter the air of that region, and in consequence of this rarefaction the air rises and ascends into the higher regions of the atmosphere. To supply its place colder air from the northern and southern regions rushes towards the equator, which, also becoming rarefied, ascends in its turn. The heated air which thus ascends into the upper regions of the atmosphere being there condensed flows northward and southward to supply the deficiency caused by the undercurrents blowing towards the equator. These undercurrents coming from the north and south are, in consequence of the earth's rotation on its axis, deflected from their course as they approach the equatorial region, and thus become north-east and south-east winds, constituting the trade-winds. The belt between the two trade-winds is characterized by calms, frequently interrupted, however, by violent storms. The position of the sun has an influence on the strength and direction of the trade-winds, for when the sun is near the tropic of Cancer the south-east wind becomes gradually more southerly and stronger and the north-east weaker and more easterly. The effect is reversed when the sun approaches towards the tropic of Capricorn. Trade-winds are constant only over the open ocean, and the larger the expanse of ocean over which they blow (as in the Pacific) the more steady they are. When these winds blow over land they are obstructed and their direction changed by coming in contact with high land or mountains. In some places the trade-winds become periodical, blowing one half of the year in one direction and the other half in the opposite direction. See MOUSOON.

But let us look a little more closely into this mysterious *tradition*, and endeavour to estimate it at its worth. It is a name for a multitude of tales and reports that were afloat in the early ages of Christianity—the hearsay of the church—compounded of fact and fiction, of the marvelous and the sober, of the

A dramatic poem, representing an important event or a series of events in the life of some person or persons, in which the diction is elevated and the catastrophe melancholy; that kind of drama which represents a tragical situation or a tragical character. Tragedy originated among the Greeks in the worship of the god Dionysus or Bacchus. A Greek tragedy always consisted of two distinct parts: the dialogue, which corresponded in its general features to the dramatical compositions of modern times; and the chorus, the whole tone of which was lyrical rather than dramatical, and which was meant to be sung, while the dialogue was intended to be recited. The unity of time; namely, that the duration of the action should not exceed twenty-four hours; and that of place, namely, that the scenes in which the events occur should be the same throughout, are modern inventions. **Transact** (trans-akt'), *v.t.* [L. *transigo*, transactum—*trans*, across, through, and *ago*, to lead, act.] To do; to perform; to manage; to complete; to carry through; as, to transact commercial business; we transacted business in person or by an agent.

**Transact** (trans-akt'), *v.t.* To conduct matters; to treat; to negotiate; to manage.

Very excellent; superior or supreme in excellence; surpassing others; as, transcendental worth; transcendental valour. 'Clothed with transcendental brightness.' *Milton*.—2. In metaph. (a) an expression employed by the schoolmen to mark a term or notion which transcended, that is, which rose above, and thus included under it, the categories of Aristotle; such, for example, as 'being,' of which the ten categories are only subdivisions. (See **CATEGORY**.) In this sense the word is convertible with transcendental as used by scholastic philosophers. (b) In the philosophy of Kant, a term applied to the elements of thought,

notions, ideas, &c., that altogether transcend experience, which may seem to be given in experience, but which really are not given. Such are the ideas of the pure reason, God, an immaterial soul, &c. In this sense the word does not correspond with transcendental as used by Kant and his followers. See **TRANSCENDENTAL**.

**Transcendent** (trans-sen'dent), *n.* 1. That which surpasses or excels; anything greatly superior or supereminent.—2. In metaph. (a) a reality above the categories or predicaments. (b) That which is altogether beyond the bounds of human cognition and thought. See the adjective.

(b) In the Kantian philos., a term used to designate the various forms, categories, or ideas assumed to be native elements of thought, or those necessary, intuitive, *a priori* cognitions which, though manifested in, as affording the conditions of experience, transcend the sphere of that contingent or adventitious knowledge which we acquire by experience; such, for instance, as the idea of space and time, causality, &c.—3. Abstractly speculative; beyond the reach of ordinary, everyday, or common thought and experience; hence, vague; obscure; fantastic; extravagant; as, transcendental poetry. [Colloquial and inaccurate use of the term.] See **TRANSCENDENTALISM**.

*Reason and understanding*, as words denominative of distinct faculties, the adjectives *sensuous*, *transcendental*, *subjective* and *objective*, *supernatural*, as an appellation of the spiritual, or that immaterial essence which is not subject to the law of cause and effect, and is thus distinguished from that which is natural, are all words revived, not invented, by the school of Coleridge. *G. P. Marsh*.

4. In math., a term applied to any equation, curve, or quantity which cannot be represented or defined by an algebraical equation of a finite number of terms, with numeral and determinate indexes. Transcendental quantities include all exponential, logarithmic, and trigonometrical lines, because there is no finite algebraical formulae by which these quantities can be expressed.—*Transcendental equation* is an equation into which transcendental quantities enter. But transcendental equations sometimes signify such differential equations as can only be integrated by means of some curve, logarithm, or infinite series.—*Transcendental curve* is such as cannot be defined by any algebraic equation, or of which, when it is expressed by an equation, one of the terms is a variable quantity.—*Transcendental anatomy*, that branch of anatomy which treats of the essential nature and homologies of the parts of the body, and the results of which study seem to differ from or lie beyond what would be suggested by the ideas of the parts conveyed by the external senses. *Brande & Cox*.

**Transcendentalist** (trans-sen'den'tal-ist), *n.* A transcendentalist.

**Transcendentalism** (trans-sen'den'tal-izm), *n.* 1. The state or quality of being transcendental. Specifically.—2. A term sometimes applied to the system of philosophy founded by Kant. In this philosophy all those principles of knowledge which are original and primary, and which are determined *a priori*, all purely subjective forms of intuition (as space and time), are called transcendental. They involve necessary and strictly (not comparatively) universal truths, and so transcend all truth derived from experience, which must always be contingent and particular. The principles of knowledge, which are pure and transcendental, form the foundation of all knowledge that is empirical, derived from experience or determined *a posteriori*. As Schelling and Hegel claim to have discovered the absolute identity of the objective and subjective in human knowledge, or of things and human conceptions of them, the Kantian distinction between transcendental and transcendental ideas can have no place in their philosophy. And hence with them transcendentalism claims to have a true knowledge of all things material and immaterial, human and divine, so far as the mind is capable of knowing them. And in this sense the word is now most generally used. It is also sometimes used for that which is vague and illusive in philosophy.

**Transcendentalist** (trans-sen'den'tal-ist), *n.* One who believes in transcendentalism.

The act or operation of changing the form or external appearance; the state of being transformed; a change in form, appearance, nature, disposition, condition, or the like; as (a) change of form in insects; metamorphosis, as from a caterpillar to a butterfly. [Note. By some zoologists the term *transformation* is restricted to designate the series of changes which every germ undergoes in reaching the embryonic condition; those which we observe in every creature still within the egg; and those which the species born in an imperfectly developed state present in the course of their external life; while metamorphosis, according to the same authorities, is defined as including the alterations which are undergone after exclusion from the egg, and which alter extensively the general form and mode of life of the individual.] (b) The change of one metal into another; transmutation of metals, according to the alchemists. (c) In *math.* the operation or process of changing in form or expression; as, (1) the change of a given geometrical figure into another of equal area, but of a different number of sides, or of a given solid into another of equal solidity, but having a different number of faces; (2) the change of the form of an equation without destroying the equality of its members; (3) the change of the form of a fraction without altering its value. (e) In *physiol.* the change which takes place in the component parts of the blood during its passage from the minute arteries through the capillary system of vessels into the radicles of the venous system. There are three kinds of changes, designated by the terms *intussusception*, *apposition*, and *secretion*. (f) In *chem.* (1) change from solid to liquid or from liquid to gaseous state, or the converse; a change usually resulting merely from change of temperature, without any alteration in the atomic constitution of the bodies concerned, as the change of water into steam; (2) a change also resulting often from simple change of temperature, but which is accompanied by production of bodies differing profoundly in nature, chemical and physical, from the body started from, as the dissociation of steam into its component gases by the heat of incandescence.—*Transformation of forces*, the change of one form of force into another. See under **FORCE**.—*Transformation scene*, in *theatres*, a gorgeous scene at the conclusion of the burlesque of a pantomime, in which the principal characters are supposed to be transformed into the chief actors in the immediately following harlequinade.

**2.** In *surg.* the transmission of blood from the veins of one living animal to those of another, or from those of a man or one of the lower animals into a man, with the view of restoring the vigour of exhausted subjects. This operation is of old date, but seems to have generally ended in failure until about 1824, the chief cause of failure probably being the want of due precautions to preclude the air during the process. It is now frequently resorted to, but only in extreme cases, as when there is great loss of blood by hemorrhage, especially when connected with labour.

**Transfusive** (trans-fúz'iv), *a.* Tending or having power to transfuse.

The determination of the exact times of the *transits* of the heavenly bodies across the meridian of the place of observation enables the astronomer to ascertain the differences of right ascen-

alone, and the relative situations of the fixed stars, and the motions of the sun, planets, and comets, in respect of the celestial meridian. (b) The passage of one heavenly body over the disc of a larger one. But the term is chiefly restricted to the passage of the inferior planets, Mercury and Venus, over the sun's disc. The transits of Venus are of great importance in astronomy, as they afford the best means of determining the sun's parallax, and consequently the dimensions of the planetary system. These tran-

sitions may be more or less related. This word is frequently used adjectively, chiefly in such a connection as shown in the quotation, as equivalent to passing from one place or condition to another, changing, transitional.

This will prove that we are now more in a transitional state.

— Transition rocks, transition series, or transition formations, in geol. names formerly given to the older secondary rocks, or to the lowest uncrystallized stratified rocks, erroneously supposed to contain no organic remains, and so named because they were considered to have been formed when the world was passing from an uninhabitable to a habitable state. It corresponded to the graywacke formation of older geologists, now subdivided into the Cambrian and Silurian systems.

Although by far the greater part of the transitive or transitive application of words depends on context and unaccountable capriciousness of the language or the idiom, there are certain cases in which they acquire a very interesting field of philosophical application.

In grammar, taking an object after it, denoting action passing to an object that is expressed, as, a transitive verb, a transitive conjugation. A transitive verb expresses an action which passes from the agent to an object, from the subject which does, to the object on which the act is done, as in the sentence, 'Cicero wrote letters to Atticus,' where wrote is a transitive verb. All verbs not passive may be arranged in two classes, transitive and intransitive.

Transitiveness (tranz-ee-tiv-ness), n. State of being transitive.

Transitorily (tran-ee-ti-ri-ly), adv. In a transitory manner, with short continuance.

Transitoriness (tran-ee-ti-ri-ness), n. The state of being transitory, a passing with short continuance, speedy departure or evanescence.

(c) The removal of a person to heaven without subjecting him to death. (d) The act of turning into another language, interpretation, as, the translation of Virgil or Homer. 2 That which is produced by turning into another language, a version.

A translation is a work not only inferior to the original by the whole difference of talent between the writer and the translator, but also inferior to the best the translator could do under more favorable circumstances. No man can do his best with a subject which does not penetrate him, no man can be penetrated by a subject which he does not consider independently.

Harvey Motion of translation, in most motion in which all the points of the moving body move in parallel straight lines or have the same velocity. The motion of a single point considered by itself must always be that of translation. When all the points of a moving body have not the same motion, it must either move about a permanent or varying axis, or else its motion must be a compound of translation and rotation.

#### Transit of Mercury.

a. Mercury. The distant star shows the path.

the use of rare occurrences, four taking place in 1845, at intervals reckoning from the transit of 1874, in the order of 8, 122, 8, and 108 years, which gives the transit years 1858 (Dec. 6), 2004, 2012, 2117. The transits of Mercury occur more frequently, but they are of far less astronomical interest, as they cannot be used for the same purpose, the planet being too distant from us. (c) A transit instrument.

Transit (tranz-ee-t) s. t. To pass over the disc of, as of a heavenly body, as Venus like Mercury transits the face of the sun, but at longer intervals.

Transit-circle (tranz-ee-t-ee-kl) n. An instrument for ascertaining, at the same observation, the right ascension and declination of a heavenly body at its transit over the meridian. It differs from the mural circle in having both ends of the metallic axis resting usually on stone piers.

Transit-compass (tranz-ee-t-ee-pan) n. A species of theodolite, consisting of a telescope, combined with a compass, &c., used for running lines, observing bearings, horizontal angles, &c. Called also Surveyor's Transit.

Transit-duty (tranz-ee-t-ee-dy) n. A duty paid on goods that pass through a country.

Transit-instrument (tranz-ee-t-ee-strum-ee-ment) n. An important astronomical instrument, which consists essentially of a telescope fixed at right angles to a horizontal axis, having its ends directed to the east and west points of the horizon, so that the line of collimation of the telescope may move in the plane of the meridian. The instrument is susceptible of certain nice adjustments so that the axis can be made perfectly horizontal, and at right angles to the plane of the meridian, in which plane the telescope must move. The principal use of the transit instrument is to determine the exact moment when a celestial body passes the meridian of the place of observation. See TRANSIT.

The rate of motion varies with the composition of the gas, but bears a constant relation not coinciding with density, diffusion, or any other known property. It is a rather repulsive looking animal, somewhat resembling the land slug in shape, but having rows of longish suckers on its body, and a radiated mouth. It varies in length from 6 to 24 inches. Much skill and care is required in the operation of curing, which is performed by gutting and boiling the slugs, and spreading them out on a perforated platform over a wood fire to dry. The centre-pin is fixed in the skull, and forms an axis round which the circular edge of the saw rotates, and as soon as the teeth of the saw have made a circular groove in which they can work steadily the centre-pin is removed. The saw is made to cut through the bone, not by a series of complete rotations such as are made by the trepan, but by rapid half rotations alternately to the right and left, as in boring with an awl. The trephine is used especially in injuries of the head, and in cases resulting from injuries for which the removal of a portion of the brain is necessary. The use of the trephine, however, is now much more rarely required than in former times, owing to improved modes of treating cases to which it was formerly applied, and the invention of simpler and more effective instruments.

The worm is common also to several other mammals, and especially to the pig, and it is generally from it that man receives the disease. When a portion of flesh, say of the pig, containing larvae is taken into the stomach the larvae in a few days become developed into procreative adults, having in the meantime passed into the intestines. The female begins to produce embryos in extraordinary numbers, which gain entrance into the muscles by penetrating the mucous coat of the intestine and entering the capillaries, whence they are carried to their habitations by the circulation. There they disorganize the surrounding tissue, setting up at the same time morbid action in the system. The connection between the muscle-inhabiting larva and the adult intestinal parasite was not established till 1860. The larva is generally encased in a cyst covered with calcareous matter, and from the form it assumes in this case it is called at this stage *Trichina spiralis*.

**Trigonometrical** (tri-g'o-nô-met'rik-al), *a.* Pertaining to trigonometry; performed by or according to the rules of trigonometry. — **Trigonometrical canon**, a table which, beginning from one second or one minute, expresses in order the lengths which every sine, tangent, and secant have in respect of the radius, which is supposed unity. — **Trigonometrical curves**, a name given to certain curves which have such equations as  $y = \sin x$ ,  $y = \cos x$ ,  $y = a \cos x + b \cos 2x$ , &c. These curves may be constructed from the fundamental properties of the sine, cosine, &c. — **Trigonometrical lines**, lines which are employed in solving the different cases of plane and spherical trigonometry, as radius, sines, tangents, secants, cosines, cotangents, cosecants, &c. These lines, or the lengths of them, are called the *trigonometrical functions* of the arcs to which they belong. When an arc increases through all its values from 0° to 360°, the sines and cosines are positive in the first and second quadrants, and negative in the third and fourth; the tangents and cotangents are positive in the first and third, and negative in the second and fourth; the secants and cosecants are positive in the first and fourth, and negative in the second and third; and the versed sines are positive in all the four quadrants. — **Trigonometrical series**, infinite series which are of the form  $a \sin x + b \sin 2x + c \sin 3x$ , &c., and  $a \cos x + b \cos 2x + c \cos 3x$ , &c. — **Trigonometrical survey**, a term which may be applied to any survey of a country which is carried on from a single base, by the computation of observed angular distances; but the term is usually confined to measurements on a large scale, embracing a considerable extent of country, and requiring a combination of astronomical and geodetical operations. A trigonometrical survey may be undertaken either to ascertain the exact situation of the different points of a country relatively to each other, and to the equator and meridians of the terrestrial globe, for the purpose of constructing an accurate map, or to determine the dimensions and form of the earth, by ascertaining the curvature of a given portion of its surface, or by measuring an arc of the meridian. The most minute accuracy and the most perfect instruments are required in all the practical parts of such operations; and it becomes necessary to have regard to the curvature of the earth's surface, the effects of temperature, refraction, altitude above the level of the sea, and a multitude of circumstances which are not taken into account in ordinary surveying. In conducting a trigonometrical survey of a country (as the ordnance survey of Britain), signals, such as spires, towers, poles erected on elevated situations, or other objects, are assumed as at great a distance as will admit of distinct and accurate observations, with telescopes of considerable power attached to the instruments used in measuring the angles. In this way, starting from a measured base-line, the country will be divided into a series of connected triangles called *primary triangles*; and any side of any one of these being known, the remaining sides of all of them may be computed by trigonometry. By means exactly similar, each of these triangles is resolved into a number of others called *secondary triangles*; and thus the positions of towns, villages, and other objects are determined. The length of the base or line measured, which is an arc of a great circle, must be determined with extreme accuracy, as an error in measuring it would affect the entire survey. For checking the measurements and the computations it is proper to measure some other line at a considerable distance from the first, as the comparison of its measured and computed lengths will be a test of the accuracy of the intermediate operations. Such a line is called a base of verification. The measurement of a base is one of the principal difficulties in the survey, chiefly on account of the inequalities of the earth's surface, and the variations in the length of the measuring instrument, arising from the change of temperature.

The base is assumed on as flat a portion of country as can be obtained, and the chain or other measuring instrument is constructed with extreme care.

**Trigonometrically** (tri-g'o-nô-met'rik-al-ly), *adv.* In a trigonometrical manner; according to the rules or principles of trigonometry. **Trigonometry** (tri-g'o-nô-met'ri), *n.* [From Gr. *trigōn*, a triangle, and *metron*, a measure.] According to the primitive meaning of the term, the measuring of triangles, or the science of determining the sides and angles of triangles, by means of certain parts which are given; but in its modern acceptation it includes all theorems and formulæ relative to angles and circular arcs, and the lines connected with them, these lines being expressed by numbers or ratios. In fact, the principles of trigonometry are of very general application, furnishing means of investigation in almost every branch of mathematics. Trigonometry, in relation to its practical utility, may be regarded as the most important of all the applications of mathematics, especially in relation to astronomy, navigation, and surveying. Trigonometry is of two kinds, *plane* and *spherical*, the former treating of triangles described on a plane, and the latter of those described on the surface of a sphere. In every triangle there are six things which may be considered, viz. the three sides and the three angles, and the main object of the theoretical part of trigonometry is to deduce rules by which, when some of these are given, the others may be found by computation, such computations being facilitated by tables of sines, tangents, &c. In plane trigonometry any three of the six parts of a triangle being given (except the three angles), the other parts may be determined; but in spherical trigonometry this exception has no place, for any three of the six parts being given, the rest may then be determined, the sides being measured or estimated by degrees, minutes, &c., as well as the angles.

The mode in which trigonometrical definitions are given is as follows:—Let ABC be a right-angled triangle, then

$\sin A = \frac{BC}{AB}$ ;  $\cos A = \frac{AC}{AB}$ ;  $\tan A = \frac{BC}{AC}$ ;  $\cot A = \frac{AC}{BC}$ ;  $\sec A = \frac{AB}{AC}$ ;  $\csc A = \frac{AB}{BC}$ ;  $1 - \sin A = \text{versed sine of } A$ ;  $1 - \cos A = \text{covered sine of } A$ . Both plane and spherical trigonometry is divided into right-angled and oblique-angled.

**Trilobite** (tri-lō-bīt), *n.* [Gr. *tri* = three, three, and *lobos*, a lobe.] One of an extinct and widely-distributed family of paleozoic crustacea, nearly allied to the Phyllopora. Trilobites are especially characteristic of the Silurian strata, about a dozen genera appear in the Devonian, three or four in the carboniferous, and none higher. They comprehend those species in which the body is divided into three lobes, which run parallel to its axis. Trilobites are supposed by Burmeister to have moved by swimming in an inverted position, belly up, immediately beneath the surface of the water. When attacked they could roll themselves into a ball. They fed on small water animals, and inhabited gregariously and in vast numbers the shallow water near coasts. No antennae or limbs have yet been detected. 'Still,' says Owen, 'there can be no doubt they enjoyed much locomotive power as even the limpet and chiton exhibit.' The lenses of the eye are frequently beautifully preserved so as to be perceptible by the naked eye. In *Strophodus* each eye has 400 facets, and in *A. symmurus* 6000. The species vary greatly in size, some being no larger than a pin's head, while *A. gigas* is found 18 inches long. Pre-

though each of them being in a certain sense complete in itself, yet bear a mutual relation to each other, and form but parts of one historical and poetical picture. The term belongs more particularly to the Greek drama. On the Athenian stage it became customary to exhibit on the same occasion three separate dramas or a *trilogy*, at first connected together by a sequence of subject, but afterwards unconnected and on distinct subjects, a fourth or satyric drama being also added, the characters of which were satyrs. Shakspeare's *Henry VI* may be called a *trilogy* of Greek.

It was granted by the senate only to one who had held the office of dictator, of consul, or of prætor, and after a decisive victory or the complete subjugation of a province. In a Roman triumph the general to whom this honour was awarded entered the city of Rome in a chariot drawn by four horses, crowned with laurel, having a sceptre in one hand and a laurel wreath in the other. He was preceded by the senate and magistratus, followed by the captives in fetters, and by his army on foot. The procession advanced along the *via sacra* to where a bull was sacrificed to the laural wreath deposited in the hands of the god. Banquets and other entertainments concluded the solemnity, which was generally brought to a close in one day, though in later times it sometimes lasted for three days. Tropes are chiefly of four kinds: metaphor, metonymy, synecdoche, and irony, but to these may be added allegory, prosopopoeia, antonomasia, and perhaps some others. Some authors make figures the genus, of which trope is a species, others make them different things, defining trope to be a change of sense, and figure to be any ornament except what becomes so by such change.

It consisted of some of the arms and other spoils of the vanquished enemy hung upon the trunk of a tree or a stone pillar by the victorious army, either on the field of battle or in the capital of the conquered nation. If a naval victory, it was erected on the nearest land. The custom of erecting trophies was most general among the Greeks, but it passed at length to the Romans. It was the practice also to have representations of trophies carved in stone, in bronze, and other solid substances. In modern times trophies have been erected in churches and other public buildings to commemorate victories. — 2. Anything taken and preserved as

The northern one touches the ecliptic at the sign Cancer, and is thence called the *tropic of Cancer*, the southern one being for a similar reason called the *tropic of Capricorn*. The sun's annual path in the heavens is bounded by these two circles, and they are called *tropics*, because when the sun, in his journey northward or southward, reaches either of them, he, as it were, turns back, and travels in an opposite direction in regard to north and south. — 2. Is any one of two parallels of latitude, each at the same distance from the terrestrial equator as the celestial tropics are from the celestial equator. The one north of the equator is called the *tropic of Cancer*, and that south of the equator the *tropic of Capricorn*. As the avoirdupois pound (the weight in general commercial use) contains 7000 grains, and the ounce 437½ grains, the troy pound is to the avoirdupois as 144 to 175, and the troy ounce to the avoirdupois as 192 to 175.

The simplest example of a truss is the principal or main couple of a roof, in which a *c* (fig. 1), the tie-beam, is suspended in the middle by the king-post *b* to the apex of the angle formed by the meeting of the rafters *e*. The feet of the rafters being tied together by the beam *a*, and being thus incapable of yielding in the direction of their length, their apex becomes a fixed point, to which the beam *c* is trussed or tied up to prevent its sagging, and to prevent the rafters from sagging there are inserted the struts *d*. There are other forms of truss suited to different purposes, but the conditions are the same in all, viz. the establishing of fixed points to which the tie-beam is trussed. Thus, in fig. 2, two points *a*, *c*, are substituted for the single one, and two suspending posts are required. These are called *queen-posts*, and the truss is called a *queen-post truss*. The principle of the truss has been widely adopted in bridge building. See **ROOF**. — 6. In arch, a large corbel or modillion supporting a mural monument, or any object projecting from the face of

Fundamental truths, like the lights of heaven, are not only beautiful in themselves, but give light to other things, that, without them, could not be seen.

According to Dr. Reid, the truths that fall within the compass of human knowledge, whether they be self-evident or deduced from those that are self-evident, may be reduced to two classes, namely, necessary, immutable, or first truths, and contingent and mutable truths. A necessary truth is one that depends not upon the will and power of any being; it is immutably true, and its contrary impossible. A contingent truth is one which depends upon some effect of will and power, which had a beginning and may have an end. Of the first class are the relations of numbers (as that two and two make four), axioms in mathematics, and all the conclusions drawn from them; that is, the whole body of the science of mathematics. To the second class of truths, viz., those that are contingent, belong all those truths that express matters of fact or real existences (as that grass is green), depending upon the will and power of the Supreme Being.—*In truth*, in reality; in fact; in sincerity.

Those which are in good condition often perish soon after the bite is inflicted, with staggering and blindness, as if the brain were affected by it. Sudden changes of the temperature produced by falls of rain seem to hasten the progress of the complaint, but in general the emaciation goes on uninterruptedly for months, and, so what we will, the poor animals perish miserably.

growth, and not a mere enlargement of a natural part, which is called hypertrophy. Tumours may be divided into three well-defined classes: (a) *simple, solid, benign, or innocent tumours*, the substance of which has anatomical resemblance to some tissues of the body; they gradually increase in size, and generally only produce inconvenience from the great bulk they sometimes attain; a complete cure may be effected by simple excision. (b) *Malignant or cancerous tumours*, which bear no resemblance in substance to normal tissue; they are exceedingly liable to ulceration, they invade all the textures of the part in which they occur, affecting the mass of the blood, and terminate fatally; when excised they are apt to recur in remote parts of the body. (c) *Semimalignant tumours*, which closely resemble in structure the part in which they are seated; they may recur after excision, or may gradually spread to all the neighbouring tissues, and ultimately cause death by ulceration; but they do not affect the lymphatic system nor reappear in remote parts of the body after excision. Innocent tumours are often named from the tissues in which they occur, as *adipose or fatty tumours*, *fibrous tumours*, *cartilaginous tumours*, *bony tumours*, and the like. Its specific gravity varies from 17.5 to 18.5. When heated to redness in the open air it takes fire, and is converted into *tungstic oxide* (WO<sub>3</sub>), and it undergoes the same change by the action of hydrochloric acid. Digested with a concentrated solution of pure potash, it is dissolved with disengagement of hydrogen gas, and tungstate of potash is generated. The ores of this metal are the native tungstate of lime, and the tungstate of iron and manganese, which latter is also known by the name of wolfram, and the same name is also given to the metal. The oldest and simplest is the Scotch turbine, or Barker's mill (which see). In another common form the water passes vertically down through the wheel between fixed screw blades, which give it a spiral motion, and then strikes similar blades attached to a movable spindle, but placed in the opposite direction, so that the impact of the water communicates a rotatory motion to the blades and spindles. Or the

3 The art or operation of giving circular and

other forms to bodies, as wood, metal, bone, ivory, &c., by making them revolve in various manners in a machine called a *lathe*, and applying cutting instruments so as to produce the form required, or by making the cutting instrument revolve when the substance to be operated upon is fixed. In ordinary turning the body operated upon is made to revolve on a stationary axis, and a cutting tool applied to its surface in such a way as, in the circumvolutions of the object, to cut off those parts which lie farthest from the axis, and make the outside of the substance concentric with the axis. In this case any section of the work made at right angles to its axis will be of a circular figure; but there are methods of turning several other curves in a variety of ways. See *LATHE* and *ROSE-ENGINE*. —4. *pl*. The chips detached in the process of turning. —5. *Mét.* a manoeuvre by which an enemy or position is turned. —6. **Turnip** (tér'nip), *n*. [Formerly also *turnep*. The latter part of the word is a Sax. *nay*, Icel. *næpa*, Sc. *neip*, a turnip, borrowed from *L. napus*, a turnip or plant allied to the turnip. It is difficult to account for the first syllable. It may perhaps be *W. tor*, something bulging, a belly, the epithet being applied to distinguish the turnip from the rape or cabbage that do not have a swelling root; but this explanation is not quite satisfactory.] The common name of the *Brassica Rapa*, a cruciferous, biennial plant, much cultivated both in the field and in the garden on account of its excellent root. The radical leaves are oblong and lyrate, the upper ones entire; the flowers usually yellow. The upper part of the root, which in the wild state is a comparatively hard woody substance, has been transformed by cultivation into a large fleshy bulb. The turnip, as a culinary vegetable and as a cattle food, was well known to the Greeks and Romans, the latter of whom may have introduced it into gardens in Britain. The root is generally used as a culinary vegetable in all temperate climates; the leaves and flower-shoots are used as greens, and the seed-leaves as a salad. The field culture of the larger-rooted varieties has proved of great advantage to the British farmer, supplying a very valuable rotation crop, and providing a winter food for cattle and sheep. The most advantageous mode of field culture is by drills, which will produce crops of treble the weight of those grown in the broadcast manner. The roots of the turnip have often a tendency to divide and become hard and worthless—a condition known as finger-and-toe, or dactylorhiza. This disease seems to be a tendency of the plant to return to the wild state, and is best met by the farmer using new and selected seed. The plant thrives best on a rich and free soil and in moist cloudy weather. The Swedish turnip is probably a hybrid between *B. campestris* and *B. Rapa* or *Napus*. *B. Napus* yields rape, cole, or colza seeds, from which a well-known fixed oil is expressed.

*A. thalia centifolia*. The larva of this fly, popularly known as *nigra*, are very destructive to the leaves of the turnip, and

The faint light which is reflected upon the earth after sunset and before sunrise; crepuscular light. The word when used without qualification is usually understood as applying to evening twilight, while morning twilight is distinguished as the dawn. The twilight is occasioned by the reflection of sunlight from the higher

parts of the atmosphere which are still illuminated after the sun has become invisible from ordinary heights. The morning twilight is said to begin, and the evening twilight to end, in our latitudes when the sun is 18° below the horizon, but much depends on the state of the atmosphere as to clouds, &c. Twilight is of longer duration in high latitudes than at or near the equator on account of the obliquity of the sun's course. When he sinks perpendicularly below the horizon naturally there is little twilight — 2. A faint light in general. 'Mid the dim twilight of the laurel grove.' *Milman*. Hence — 3. **Twill** (twil), *n*. 1 A variety of textile fabric very extensively employed. In the twill the warp-threads do not pass over and under the weft-threads in regular succession, as in common plain weaving, but pass over one and under two, over one and under three, or over one and under eight or ten, according to the kind of twill. The effect of this is to produce the appearance of parallel diagonal lines or ribs over the whole surface of the cloth, but the regularity of the parallel lines is broken in various ways in what is termed *fanciful twilling*. — 2 The raised line made by twilling.

There are several varieties of machines for this purpose, but ordinarily they all possess the following leading features: they have separate galleys or pockets for each sort of type, and the mechanical arrangement is such that on touching a key, arranged with others like the keyboard of a piano, the end type of the row is displaced, and conducted in a channel or by a tape to a composing-stick, where the types are arranged in a regular order in a line of indefinite length; thence they are removed in successive portions to a justifying stick, in which they are spaced out to the proper length of line required.

**Type-writer** (tîp'rit-er), *n.* A machine intended to be used as a substitute for the pen, and by which the letters are produced by the impression of inked types. The essential elements in such machines (of which there are several varieties) is a movement to bring the type into position, an inking device, an impression movement, and means for letter and line spacing. A successful form of the machine has a series of letter keys arranged in four rows, to be worked by the fingers of both hands, a letter being imprinted on the paper (which moves automatically) each time a key is struck.

In the typical species, the common typhline (or blind acrotias), the limbs are entirely wanting, and the animal looks utterly helpless, having no apparent legs, feet, eyes, or ears. It is a native of South Africa.

**Typhlopidæ** (tîf'lop'i-dé), *n. pl.* [Gr. *typhlops*, from *typhlos*, blind, and *ops*, the eye or face.] A family of reptiles, distinguished from the typical ophiidians by the comparative narrowness of their gape, and by their habit of burrowing in the ground; and so named because the eye resembles a point hardly visible through the skin. They resemble at first sight earthworms, and are found in the hot portions of both hemispheres. They differ from all other reptiles in possessing teeth in only one of the jaws. The typical genus is *Typhlops*, and there are several others.

**Typhoid** (tî'foid), *a.* Of, pertaining to, or resembling typhus; as, a *typhoid fever*; *typhoid symptoms*.—*Typhoid fever*, a species of continued fever, characterized by abdominal pains and diarrhoea due to ulceration of the intestines, frequently by derangement in the functions of the lungs and brain, by spots on the skin, and analogous in many respects to eruptive fevers. Unlike the spots of typhus those of typhoid fever disappear on pressure. By some authorities typhoid and typhus fevers have been regarded as the less and greater degree of one common disease, but the majority of physicians now consider them to be distinct diseases with certain resemblances. Typhus has generally prevailed as an epidemic where insanitary conditions, overcrowding, and famine have prevailed; the rebreathing of air loaded with emanations from crowded living beings being its chief cause. Typhoid, on the other hand, is now far more common, occurring among all classes of society, in isolated and healthy villages, as well as in the larger cities. It may be induced by purely external causes, as by bad ventilation, sewer-gas, exhalations of decomposing matter in cellars or near houses, privies, and especially the contamination of drinking water. It is also of longer duration than typhus, there being at least three full weeks of the active fever, followed by several weeks' gradual convalescence, while in the average from typhus speedy recovery ensues at the end of the second week. Known also as *Enteric* and *Gastric Fever*.

**Typhous** (tî'fus), *a.* Relating to typhus.

**Typhus** (tî'fus), *n.* [Gr. *typhos*, stupor or coma.] A species of continued fever attended by great debility. It is contagious or infectious, and often epidemic, but is most prone

to attack debilitated persons, and is aided in its progress by want of cleanliness, good food, and fresh air. With the sanitary reform of overcrowded localities, barracks, jails, ships, &c., the prevalence of this plague has now been considerably diminished. Its attack is generally characterized by inordinate muscular and nervous debility, great depression of spirits, weariness, flying pains, sighing, and a frequent, small, and sometimes fluttering pulse. The tongue is foul and brown, and the taste impaired, and not unfrequently nausea and bilious vomiting prevail. About the fourth or fifth day an eruption of a deep livid colour appears on the abdomen, the spots of which do not disappear on pressure, as those of typhoid do. As the disease advances the debility increases; the speech becomes inarticulate, muttering, and delirious, and there is a tendency to bleeding from the nose, mouth, and bowels. Typhus is frequently fatal, death in the majority of cases supervening before the fifteenth day after attack. This disease is also known as hospital fever, ship-fever, jail-fever, camp-fever, brain-fever, and spotted fever, and has sometimes been considered as an acute form of fever of which typhoid is a less virulent example. See *TYPHOID*.

# U.

**U.** The twenty-first letter and the fifth vowel in the English alphabet. Its true primary sound was that which it still retains in most of the languages of Europe, that of *oo* in *cool*, *tool*, *good*, *wood*, &c., answering to the French *ou* in *tour*, the sound being sometimes short, sometimes long. This sound is one of the original Indo-European vowel-sounds. (See **A**.) In Anglo-Saxon the long sound was often marked with an accent to distinguish it from the short. The former has in modern English commonly become the diphthong *ou* or *oo*, as *A. Sax. thū = thou*, *nā = now*, *mūth = mouth*, &c. After *r*, however, and also after the sounds *sh* and *zh*, *u* has generally the old long sound, as in *rule*, *truth*, *sure*, &c., and the same sound differently represented is still heard in *room* = *A. Sax. rōm*, *brook* (verb) = *A. Sax. brōc*. The old short sound of *u* is still retained in some words, as in *bull*, *full*, *put*, &c., but in general this sound became changed (apparently about the middle of the seventeenth century) to the sound heard in *cut*, *tun*, &c., which was a new sound in English. In *us*, *but*, the *u* was originally long. This sound, which is very similar to that of the unaccented French *e*, is characteristic of English, and is often given to the other vowels, *a*, *e*, *o*, when unaccented, as in the words *cavalry* *sister*, where the italicized vowels have almost, if not altogether, this indistinct, stifled *u*-sound. In the case of *o* this pronunciation is not confined to unaccented vowels, as in numerous instances the accented *o* is exactly equivalent to this sound of *u*; for example, *come*, *money*, *among*, &c. The long sound that this letter commonly represents at the present day, as in *mute*,

*pure*, *duke*, *diffuse*, &c., is not a simple vowel, the *u*-sound having really an *i*-sound before it. This latter sound seems to have established itself about the beginning of the seventeenth century. Some speakers give *u* this sound even after *r*, but the letter is not commonly so pronounced. Vulgar speakers, again, pronounce such words as *duke*, &c., as if they were written *doak*, &c. The words *bury* and *busy* (with their derivatives) exhibit solitary peculiarities in the pronunciation of this character. The sound of *u* in *mute* is also represented by other combinations, as by *u* in *due*, *eu* in *dew*, and *ui* in *suit*. With regard to the remark has been made 'that it is used in later spelling as a final *u* owing to a rule made by no one knows whom, no one knows why, and no one knows when, that no English word can end in *u*.' (*A. J. Ellis*.) In *plague*, *rogue*, &c., *ue* indicates that the preceding vowel is to be pronounced long and the *g* with its hard sound; in *tongue* it is a useless excrement. Besides the sound in *suit*, *ui* has several other sounds, as in *build*, *guide*, *fruit*, *anguish*, *mosquito*, &c. In *buy* the *u* is no longer heard, and probably it never was heard in *buy*. In the best period of Roman literature the *u*-sound was expressed by the character *v*. The Anglo-Saxon alphabet did not have the character *v* at all, the sound, when it occurred (as between two vowels) being represented by *f*, or occasionally by *u*. In later times *u* and *v* stood indifferently for either sound, the capital being generally written *v*. In the seventeenth century its special function was assigned to each, yet almost every dictionary continued to combine the *u* and *v*, and this was not

quite given up till far on in the present century.—*U*, in *chem.* is the symbol of uranium. *U.C.*, in dates belonging to Roman history, is a contraction for *ab urbe condita*, from the time the city was built; as, *U.C. 400*, the year of Rome 400. *U.K.*, the United Kingdom. *U.F.*, in Scotland, United Free-

In *philol.* the change of a vowel in one syllable through the influence of one of the vowels *a*, *i*, *u* in the syllable immediately following—a common feature in several of the Teutonic tongues. In German umlaut is seen in the frequent change of the vowels *a*, *o*, *u* to *ä*, *ö*, *ü*. In Anglo-Saxon it was very common, and it still appears in the plurals *feet* and *geese*, from *foot* and *goose*, the vowels being changed by an *i* that originally followed. Umlaut is therefore a kind of assimilation of sounds. The change caused by *a* is called *a-umlaut*, and so of the others.

The conception of a sound tends to put the vocal organs in a position to utter it. We conceive the later sounds in a word while yet speaking the former; hence the tendency to utter a sound between the two. No umlaut shows in Gothic. Old H. German has most *a-umlaut*; Norse, *u-umlaut*. *Prof. March.*

The loss of initial *n* (see *APRON*) would be assisted by the collateral form *impir*, from Fr. *impar*, *L. impar*, uneven, odd. Lit. an odd person, in addition to a pair.] 1. In O.E. words with this prefix were not uncommon.] Boundary line; extreme edge. 'Such towns as stand on the very umsstroke, or on any part of the utmost line of a map.' *Fuller*.

**Un-** A prefix derived from two sources with two uses, viz. those of negation and those of reversal or undoing, and hence privation. 1. [A. Sax. *un*, O.Sax. and Goth. *un*, G. *un*, D. *un*, Icel. *ú*, *ó*; cog. with *L. in*, Gr. *an*, *a*, Skr. *an*, *a*, all signifying not.] Expressive of simple negation. In this sense it is used chiefly before adjectives, past participles passive, and present participles used adjectively, and when so used it signifies simply not; as, *unable*, *unfair*, *untrue*, *untruthful*, *unwise*, *uninvited*, *unwedded*, *unseen*, *unaccommodating*, *unchanging*, *undoubting*, *unthinking*, &c. From such words again adverbs in *-ly* and nouns in *-ness* are formed; hence, *unfairly*, *unfairness*, *untruthfulness*, *unchangingly*, &c. It is also directly prefixed to some nouns to express the absence or contrary of what the noun expresses, as in *untruth*, *undress*, *unrest*, *unwisdom*, &c. Before many words of Latin origin, *un*, in the sense of mere negation, is naturally represented by *in* or by *non*, and sometimes by *dis*; thus, for *uncomplete* we have *incomplete*; for *unability*, *inability*; for *unelastic*, *inelastic* and *non-elastic*; for *unemphatic*, *non-emphatic*; for *unreputable*, *disreputable*, &c.—2. [A. Sax. *on*, *ond*, *and*, as in *on-léasan*, to unlock, *on-léasan*, to unloose,

and *on-arian*, to answer, &c.; Icel. O.Sax. and Goth. *and*, G. *ant*, as in *ant-worten*, to answer; cog. *L. ante*, before; Gr. *anti*, against, opposite; Skr. *anti*, over against.] Prefixed to verbs (generally active transitive) it signifies properly the reversing or annulling of the action expressed by the verb; as, *undo*, *unlearn*, *unlock*, *unmake*, &c. When prefixed to nouns it changes them into verbs implying privation of the object named by the noun or of the qualities connoted by it. Thus *unfrock*, *uncowl*, *uncoat*, *unhelm*, &c., signify to deprive or divest of a frock, cowl, &c., while *unman*, *unsex*, *unshape*, signify to deprive of the qualities of a man, sex, &c. This is sometimes called *un-privative*. Another peculiar use of this *un* is found in a few verbs, chiefly obsolete, where it is used in the sense of retract or revoke, as *unpredict*, *unsay*, *unapeak*, *unswear*, to retract a prediction, a saying, &c. As further illustrating the force of *un* in both its senses we may remark that under the form *unlearned* we have really three words—one an adjective signifying illiterate; as, an unlearned man (*un*, not, and *adj. learned*); one a true past participle of the active verb to unlearn (*un* in sense 2 and *learn*); as, all you have learned must be unlearned; and, finally, one formed by prefixing *un* negative to the past participle of the active verb to learn; as, his task is still unlearned. Some words with *un*-prefixed are hardly used unless qualified by *not*; thus we speak of a striking prospect, but we should not be likely to say an *unstriking* prospect, though we should readily say the prospect is *not unstriking*.—[*Note*.] Adjectives and participles with the prefix *un* in the sense of not, being almost unlimited in number, and their meaning generally so obvious, many of them are omitted from this work, as well as their derivative adverbs in *-ly* and nouns in *-ness*. When such words, however, have a special signification or usage of their own, and are not simply to be explained as equivalent to 'not' and their later element, they are admitted into the vocabulary. As words of this kind may be instanced *unruly*, *unconscionable*, *unpretending*, *unparalleled*, *unsafe*, and the like. Verbs and nouns with *un* as a prefix (such as *unlock*, *untruth*) are also carefully defined, as they belong to a limited class, and are not coined at will by writers or speakers. It may also be added that a number of the words below have only been inserted because used by writers of more or less eminence.]

traverses the different parts of a body, as the waves of the sea and they are said to be stationary when all the particles of a body begin their vibrations simultaneously and end them at the same instant.—4 In used a particular uneasy sensation of an undulatory motion in the heart.—5 In sury a certain motion of the matter of an abscess when pruned, which indicates its fitness for opening.

**Undulatory** (un-doh-lä'toh-riv), *a.* Having an undulating character, moving in the manner of waves resembling the motion of waves which successively rise or swell and fall pertaining to such a motion, as the undulatory motion of water, of air, or other fluid. Undulatory theory, in optics, the theory which regards light as a mode of motion generated by molecular vibrations in the luminous source, and propagated by undulations in a subtle medium (ether), essentially imperceptible, presumed to pervade all space, including the intervals which separate the molecules or atoms of ponderable bodies. When these undulations reach and act on the nerves of our retina, they produce in us the sensation of light. The only other theory of light which can be opposed to this, and which is variously called the corpuscular emission, or material theory supposes light to consist of material particles, emitted from the source and projected in straight lines in all directions with a velocity which continues uniform at all distances and is the same for all intensities. It would seem that every phenomenon which can be brought under the corpuscular theory can with equal facility be explained by the undulatory theory, while there are some known effects, as the phenomena of reflection and refraction, in strict accordance with the principles of the latter, which cannot, without great difficulty and the introduction of gratuitous suppositions, be accounted for by the corpuscular theory. The undulatory theory is therefore now generally adopted by physicists.

2. In *philos.* a general notion or idea; that which by its nature is fit to be predicated of many; that which by its nature has a fitness or capacity to be in many. Universals have been divided into *metaphysical*, or those archetypal forms existing in the divine mind and forming the patterns after which all things were created; *physical*, or certain common natures diffused over or shared in by many, as *rationality* by all men; and *logical*, or general notions framed by the human intellect, and predicated of many things, on the ground of their possessing common properties, as *animal*, which may be predicated of man, lion, horse, &c. In *anc. philos.* the universals were called *predicables*, and were arranged in five classes, *genus, species, differentia, proprium, and accidentis*.

The same colour being observed to-day in chalk or snow which the mind yesterday received from milk, it considers that appearance alone makes it a representative of all of that kind, and having given it the name of whiteness, it by that sound signifies the same quality wheresoever to be imagined or met with, and thus *universality*, whether ideas or terms, are made. *Locke*.

**Universe** (û-ni-vêr-s), *n.* [Fr. *univers*, from L. *universum*, the universe, neut. of the adj. *universus*, all together, all taken collectively, the whole. See *UNIVERSAL*.] The general system of things; all created things viewed as constituting one system or whole; the whole creation; the world; the *topan* of the Greeks and the *mundus* of the Latins.

For nothing this wide universe I call,  
Save thou, my rose; in it thou art my all. *Shak.*

— *World, Universe, Creation*. *World* properly signifies this globe and everything inhabiting it, as animals and vegetables, or immediately associated with it, as the atmosphere, &c. *Universe* designates the entire mass of worlds, with everything associated with them, comprehending all stars, planets, satellites, comets, &c., regarded as one system. *Creation*, in its most extended sense, is nearly synonymous with *universe*, differing from it principally in not comprehending the Great First Cause and the idea of space. It is often used in a sense limited by the epithet or qualifying word preceding it; as, *the brute creation*, *the rational creation*.

**University** (û-ni-vêr-sal-ti), *n.* [L. *universitas*, the whole of anything as contrasted with its parts, the universe; later, an association, corporation, company, &c.] 1. † The whole; the universe. 'Speaking with respect to the university of things.' *Barrow*. — 2. † A corporation; a guild. — 3. In the modern sense of the term, an establishment or corporation for the purposes of instruction in all or some of the most important branches of science and literature, and having the power of conferring certain honorary dignities, termed *degrees*, in several faculties, as arts, medicine, law, and theology. In most cases the corporations constituting universities include a body of teachers or professors for giving instruction to students; but this is not essential to a university, the staff of London University being merely an examining body. In the middle ages, when the term began to be used in reference to seminaries of learning, it denoted either the whole body of teachers and learners, or the whole body of learners, with corporate rights and under by-laws of their own, divided either by faculty or by country (hence the 'nations' into which the students were classed), or both together, its meaning being determined by the words with which it was connected. At a later period the expression *universitas literarum* (the whole of literature or learning) was used to indicate that all the most important branches of knowledge were to be taught in these establishments; and it would seem that the twofold application of *universitas* led to the distinctive meaning of the term as now used. Some, forming their notion of the word *university* merely from the English universities, suppose that it necessarily means a collection and union of colleges, that it is a great corporation embodying in one the smaller and subordinate collegiate bodies; but this is not correct, for many universities exist in which there are no colleges. This is the case with most of the German universities, and in the Scottish universities there are no foundations which bear any resemblance to the English colleges. Besides, the universities of Oxford and Cambridge existed before a single college was endowed. The oldest of the European universities were those of Bologna and Paris, and these formed the models on which the other universities which subsequently sprung up in various parts of Europe were established.

planet, discovered by Sir William Herschel in 1781. It was first called *Georgium Sidus* in honour of George III, afterwards called *Herschel*, in honour of the discoverer. It is the seventh planet in order of distance from the sun. It presents the appearance of a small round uniformly illuminated disc, without rings, belts, or discernible spots. To the naked eye it appears like a star of the sixth magnitude. Its mean distance from the sun is about 1784 millions of miles, and the length of the year 30688.33 days, or about 84 of our years. Its mean diameter is estimated at about 33,000 miles. Its volume exceeds the earth's about 74 times, but as its mean density is only 0.17 (the earth's being 1) its mass is only about 1/14 times more. The length of its day is supposed to be between 9 and 10 hours. There is still some uncertainty as to the number of satellites belonging to Uranus. Herschel records six, and two of the four which are seen by astronomers at the present time cannot be identified with any of these. The satellites of Uranus differ from the other planets, primary and secondary (with the exception of Neptune's satellite), in the direction of their motion, which is from east to west, and they move in planes nearly perpendicular to the ecliptic.

It occurs in small quantity in the healthy urine of man and quadrupeds, and in much larger quantity in the urine of birds. The semi-fluid excretions of birds and serpents are principally composed of uric acid and urate of ammonia; and guano, which is the decomposed excrement of aquatic birds, is mainly impure uric acid in a remarkable state of decomposition. Uric acid constitutes the principal proportion of the urinary calculi and the concretions causing the complaint known as the gravel. It crystallizes in fine scales of a brilliant white colour and silky lustre; it is inodorous and insipid, heavier than water, and nearly insoluble in it when cold, and only slightly dissolved by it when hot; the solution reddens litmus paper, but feebly. When it is dissolved in nitric acid, and the solution is evaporated and treated with ammonia, a fine purple colour is produced; by this reaction uric acid may be detected.

There are about 130 species, two of which are British. These plants are found in abundance in temperate Europe, Asia, and North and South America. *V. officinalis*, the official or great wild valerian, is a native of Europe, and grows abundantly by the sides of rivers, and in ditches, and moist woods in Great Britain. The root has a very strong smell, which is dependent on a volatile oil. Cats and rats are very fond of it, and rat-catchers employ it to decoy the latter. It is used in medicine in the form of infusion, decoction, or tincture, as a nervous stimulant and antispasmodic. Besides valerian oil the root contains starch, extractive matter, resin, and valeric acid. *V. rubra*, or red valerian, is occasionally found wild in Britain, and is cultivated in gardens as well as many other species on account of its elegant flowers. *V. Phu* is the garden Greek valerian, and *V. Dissonoidis* the ancient Greek valerian.

In France and Germany it is much eaten as a salad, and is frequently cultivated for that purpose in this country. There are about fifty species, three or four of which are British.

**Valerianic** (və'leɪ-ən) *n.* Pertaining to valerian. - *Valerianic* acid (C<sub>10</sub>H<sub>14</sub>O<sub>4</sub>), an acid produced by the oxidation of amylic alcohol. It is also extracted from the root of *Valeriana officinalis*, hence the name. Valerianic acid is a limpid oily fluid, of a disagreeable and peculiar smell. metal discovered by Selström in 1830 in iron prepared from the iron ore of Taberg in Sweden. It was afterwards obtained by the same individual in the slag formed during the conversion of the cast-iron of Taberg into malleable iron. It has since been found in a lead ore from Wanlockhead in Scotland, and in a similar mineral from Zimapan in Mexico, and in the sandstone of Alderley Edge, and Mottram St. Andrew, Cheshire. The metal was first obtained by Roscoe, who showed that the substance generally regarded as vanadium was really an oxide. Vanadium has a strong metallic lustre, considerably resembling silver, but still more like molybdenum. When in mass it is not oxidized either by air or water, but the finely powdered metal quickly takes up oxygen from the air. Oxygen and vanadium combine to form five oxides—viz. a monoxide ( $V_2O$ ), a dioxide ( $V_2O_2$ ), a trioxide ( $V_2O_3$ ), a tetroxide ( $V_2O_4$ ), and a pentoxide ( $V_2O_5$ ).

**Vapour** (vā'por), *n.* [L. *vapor*, steam, vapour; from same root as *apidus*, vapid, having lost flavour, *vappa*, wine that has become vapid; comp. Goth. *afwaspan*, to be suffocated.] 1. In physics, a term applied to designate the gaseous form which a solid or liquid substance assumes when heated. Vapour is, therefore, essentially a gas, and seeing that all known gases have now been proved to be liquefiable, no physical difference can be said really to exist between an ordinary gas, such as oxygen, and a vapour, such as steam. In common language, however, a difference is usually recognized: a gas is a substance which at ordinary temperatures and pressures exists in a state of vapour; while a vapour is produced by the application of heat to a substance which normally exists in a solid or liquid form. The difference has been otherwise explained to be one not so much of kind as of degree; steam in the boiler of a steam-engine being said to be in a state of vapour, while superheated steam is said to be a gas. Aqueous vapour formed on the surface of the land and water

is always present in suspension in the atmosphere, and when it meets with a reduction of temperature it condenses into water in the form of rain or dew. See EVAPORATION. 2. In a more general and popular sense, any visible diffused substance floating in the atmosphere and impairing its transparency, as fog or mist; hazy matter.

In *astron.* any deviation from the mean orbit or mean motion of a heavenly body, occasioned by another disturbing body. When these deviations are compensated in comparatively short periods of time they are called *periodic variations*, but when the compensation requires an immense period of time for its consummation the variation is called a *secular variation*. — *Variation of the moon*, an inequality in the moon's rate of

motion, occasioned by the attraction of the sun, and depending as to its degree on the moon's position in her orbit. — 6. In *physics* and *navigation*, the deviation of the magnetic needle, or needle of the mariner's compass, from the true north point; or the angle which the needle makes with the plane of the meridian of a ship or station; called also *Declination*. The variation of the compass does not remain constantly the same in the same place, but undergoes a slow and progressive change. The needle is observed to move gradually towards the west of the true meridian until it arrives at its maximum on that side; it then returns, passes over the true meridian, and moves easterly, until it arrives at its maximum towards the east, when it returns as before. In the year 1576, in London, the variation was 11° 15' east; in 1662, the needle pointed due north, after which time it travelled about 24° to the westward (the maximum being in 1815); it is now considerably less and is continually decreasing. The variation, however, is very different in different parts of the globe, and it is also subject to diurnal changes in the same place. — 7. In *music*, one of a series of ornamental changes or embellishments in the treatment of a tune, movement, or theme during several successive repetitions. The simplest kind of variation is by introducing into the melody a greater or less number of passing notes (that is, notes intermediate in pitch between the original notes of the air), together with cadenzas, scale movements, and the like, or by breaking of the chords into triplets, quadruplets, &c., or throwing them into arpeggio form, the fundamental harmony usually remaining unchanged. In more elaborate styles, however, new harmonies, rhythms, and melodic developments gradually appear, often brilliantly displaying the fertility of the composer's fancy. In many cases variations are mere unmeaning ornaments designed to exhibit the mechanical dexterity of the performer. — *Calculus of variations*, a branch of analysis, the chief object of which is to find what function of a variable will be a maximum or minimum on certain prescribed conditions. This calculus offers the only general, and frequently the only possible, means of solving those problems generally termed isoperimetric. — *SYN.* Change, modification, vicissitude, mutation, deviation.

3 Variation, deviation, change from a former state. "A variety in things from what they now appear." *Sir M. Hale*—4 A collection or number of many different things, a varied assortment, as, he sells a great variety of articles—5 Something differing from others of the same general kind, one of many things which agree in their general features, a sort, a kind, as, varieties of rock, of wood, of land, of soil, and the like, to prefer one variety of cloth to another—6 Specifically, in scientific classifications, a subdivision of a species of animals or plants, an individual or group of individuals differing from the rest of the species to which it belongs in some accidental circumstances which are not essential to the species. Varieties are considered as less permanent than species, and those naturalists who look upon species as strictly distinct in their origin, consider varieties as modifications of them arising from particular causes, as climate, nourishment, cultivation, and the like. See the following quotation.

No one definition of species has satisfied all naturalists. For every naturalist knows vaguely that he knows when he speaks of a species. The term variety is almost equally difficult to define, but here community of descent is almost universally implied, though it can rarely be proved. Practically when a naturalist can name by means of intermediate links a series of forms, he treats the one as a variety of the other, reaching the most common, but unvarying, the one best described, as the species, and the other as the variety. But cases of great difficulty sometimes arise in deciding whether or not to rank one form as a variety of another even when they are closely connected by intermediate links. For well-marked and well-known varieties can be named which have not been ranked as species by at least some competent judges. *Darwin*

In like manner the term variety is applied to inorganic substances of the same kind, which are susceptible of classification, to note differences in colour, structure, crystallization, and the like, all the varieties being referable to some one species which is assumed as the typically perfect standard, as, varieties of quartz, diamond, and the like.

The chief of the association (the *Freigraf*—free count) was usually a man of exalted rank, and had the supreme direction of the courts. His associates (*Freischöffen*—free justices) concurred in and executed the sentences of the court, being bound by a tremendous oath to obey all its behests, and keep secret its proceedings from all that is between heaven and earth. The assemblies of the tribunal were sometimes held in public and in the open air, but were generally held by night in a forest or in some other concealed place. Any person supposed to be guilty of heresy, sorcery, rape, theft, robbery, or murder, might be summoned before the court and compelled to answer the charge brought against him by the accuser, who was one of the *Freischöffen*. If the accused was found guilty of a capital crime, or if he repeatedly refused to appear on being duly cited, it was the duty of the *Freischöffen* to put him to death. This system offered great scope for the spirit of private revenge, malice, and interested motives, and many judicial murders were perpetrated. When the governments of the various states became more effective and society more settled, the regular executive struggled to destroy the power of the *vehmgerichte*, and ultimately succeeded, the last tribunal being held at Zell in 1568.

One of a system of membranous canals or tubes distributed throughout the bodies of animals for the purpose of returning the impure blood from the extremities, surfaces, and viscera to the heart and lungs. They are devoid of elasticity, and have no pulsation, the motion of the blood being mainly secured by pressure of the moving muscles, between which they are imbedded, the backward flow of the blood being prevented where necessary by a series of valves which permit a current only towards the heart. The veins arise from venous capillaries which collect from the tissues the blood recently brought to them by the arterial capillaries. These venous capillaries unite to form ultimate veins, which still unite in turn, forming gradually larger branches and trunks as they approach the centre of the circulation. The venous blood returned from above the region of the heart is united in one great vein, the vena cava superior, all those from below entering by the vena cava inferior. The portal vein (vena porta) receives the venous blood from the intestines and conveys it through the liver to the vena cava inferior. The pulmonary vein and branches go from the right side of the heart to the lungs, carrying the blood to the air-sacs to be revived by the oxygen of the inspired air. The veins like the arteries are composed of three coats. Valves are absent in the vena porta, the portal, the pulmonary, and various other veins, and are present in greatest numbers in the veins of the extremities.—2. **Velocity** (vé-loi-ti), *n.* [Fr. *vélocité*, from L. *velocitas*, from *velox*, *velocis*, swift, rapid; from a root seen also in *velox*, a light-armed soldier (whence *velitation*); Skr. *val*, to turn about.] 1. Quickness or speed in motion or movement; swiftness; rapidity; celerity; as, the *velocity* of wind; the *velocity* of a planet or comet in its orbit or course; the *velocity* of a cannon-ball; the *velocity* of light. It is not applied to the movements of animals, or but rarely. See *CELERITY*.—2. In physics, rate of motion, whether fast or slow; the rate at which a body changes its position in space; the rate of change of position of a point per unit of time. The *velocity* of a body is *uniform* when it passes

through equal spaces in equal times, and it is *variable* when the spaces passed through in equal times are unequal. The *velocity* of a body is *accelerated* when it passes through a greater space in equal successive portions of time, as is the case of falling bodies under the action of gravity, and it is *retarded* when a less space is passed through in each successive portion of time. When the motion of a body is uniform its *velocity* is measured by the space described by it in a unit of time, as one second. If the motion of the body is not uniform its *velocity* is measured by the space which it would describe uniformly in a given time, if the motion became and continued uniform from that instant of time. The unit of space and time taken in order to measure *velocity*, may be assumed of any magnitude, but in theoretical mechanics one second is usually taken as the unit of time, and one foot as the unit of space.—*Angular velocity*. See under *ANGULAR*.—*Initial velocity*, the rate of movement of a body at starting; especially used of the velocity of a projectile as it issues from a firearm.—*Virtual velocity*. See under *VIRTUAL*.—*SYN.* Swiftness, rapidity, celerity, speed, fleetness, quickness.

*Venal* and licentious scribbles, with just sufficient talents to clothe the thoughts of a pandar in the style of a bellman, were now the favourite writers of the sovereign and the public. *Macaulay.*

—*Venal, Mercenary, Hireling*. Although both *venal* and *mercenary* are used in a bad sense, *venal* is much stronger than *mercenary*, standing to it in the relation of sale to hire. A *venal* man sells himself wholly to his purchaser, sacrificing character, honour, principle, his whole individuality, indeed, or gain; a *mercenary* man acts with a view to profit in what he does, and is actuated by sordid motives, but he does not necessarily surrender himself unreservedly, or even make any sacrifice of principle. With the mercenary man love of gain is the chief motive; with the *venal* man it is in effect the only motive. *Hireling* denotes that hire is the motive, and thus implies something servile as well as mercenary, conveying more of contempt than of reprobation.

Thus needy wits a vile revenue made,  
And verse became a mercenary trade. *Dryden.*

In ventriloquism the sounds are formed by the same organs as the emissions of sound commonly—the larynx or organ of voice, the palate, tongue, &c.—the difference consisting mainly in the mode of respiration. A very full inspiration is taken, which is breathed out slowly and gradually, the sound of the voice being dexterously modified and diminished by the muscles of the larynx and the palate. At the same time the lips of the performer are scarcely moved, and the deception is still further facilitated by the attention of the auditors being directed to the object which is sought to be regarded as the source of the voice. **Verb** (vɜrb), n. [Fr *verbe*, from L. *verbum*, a word, a verb, from same root as *E. word* (which see).] 1. A word.

2. In gram. that part of speech whose essential function is to predicate or assert something in regard to something else (the subject or thing spoken of), as, the boy runs, the man *is* the stone, fishes swim, he suffers much. Verbs have the power of indicating time and mode by means of tenses and moods, but this is not an essential property. They have been divided into active and neuter verbs, according as they predication or state. Active verbs are divided into intransitive and transitive, according as the action is confined to the actor or passes from him to an object. Intransitive verbs often take an objective of their own nature, as, he runs a race, he sleeps the sleep of death. When a verb may be used either transitively or intransitively, as, he sends the horse, he sends to church, the verb in the former use is said to be *copulative*. Many causative verbs are distinguished from their corresponding intransitives by a change of form as *set, sit, lay, fell, fold*. Some verbs are sometimes transitive, sometimes intransitive, and sometimes neuter, as, he finds a scheme, John can find now, the corpse *floats*. A small class of verbs, as *to become, exist, wax, and grow* (in such phrases as, my hair becomes white, he seems weak, he grows old), predication only existence or transition from one state to another, are called *substantive verbs*, and this name is sometimes restricted to the verb *to be*. *Finis* verbs affirm suffering or endurance of what another does. Hence, only verbs which take an object after them can have a passive voice, because it can be said of objects only that they suffer or endure the action directed on or towards them by the subject of the active verb. Passive verbs are thus the correlatives or complements of active verbs. The infinitive mood, gerund, and supine are properly verbal nouns, implying action or state only without the power of assertion. Participles are adjectives plus the action of time, and cannot therefore assert.

**Vernier** (vér'ni-ér), n. [*From the inventor, Peter Vernier*, of Brussels, who died 1637.] A small movable scale, running parallel with the fixed scale of a sextant, theodolite, barometer, or other graduated instrument, and used for measuring a fractional part of one of the equal divisions on the graduated fixed scale or arc. It consists, in its simplest form, of a small sliding scale, the divisions of which differ from those of the primary scale. A space is taken equal to an exact number of parts of the primary scale, and it is divided into a number of equal parts either greater by 1 or less by 1 than the number that it covers on the primary scale. The diagram represents the vernier of the common barometer for measuring to the hundredth of an inch. The scale *a b* is divided into inches and tenths of inches; the small movable scale *c d* is the *vernier*, and consists of a length of eleven parts of *a b*, divided into ten parts, each part being therefore equal

to one and one-tenth of the divisions upon a b, and the difference between any division on the scale and vernier will be one-hundredth of an inch. In the figure the zero of the vernier is set to the division 30 inches, the division 10 upon the vernier corresponding with that of 29 inches 9 tenths on the scale. Hence, the vernier division 1 is one-hundredth of an inch below the scale division 29 inches 9 tenths; division 2 on the vernier is two-hundredths below 29 inches 8 tenths, and so on. Supposing the vernier were raised any number of hundredths, as two hundredths of an inch, the division 2 would coincide with 29 inches 8 tenths. To read off the hundredths of an inch the vernier zero advances beyond any tenth on the scale; the division that coincides nearest with any on the scale must be taken for the hundredth required. The vernier now usually employed has one graduation more than the corresponding portion of the scale. The principle in both cases is, however, the same.

Vernier.

dorsal five lumbar. The false vertebrae consist of five sacral (united to form one bone the sacrum), and four or five sacral or caudal vertebrae. There is in every vertebra, between its body and apophyses, a foramen or hole. These foramina correspond with each other through all the vertebrae and form a long bony conduit for the lodgment of the spinal marrow. The vertebrae are united together by means of a substance compressible like cork, which forms a kind of partition between them, and admits of a certain degree of motion small between individual bones, but considerable as respects the whole spinal column. The vertebrae and small projections or processes also afford attachments for a number of muscles and ligaments, and also passages for blood vessels, and for the nerves that pass out of the spine. In different animals the number of vertebrae varies exceedingly.

**Vibrating** (vī'brē-tīng), *a.* and *v.* **Vibratory**

This column is performed by the vibrating motion of the parts.

**Vibration** (vī'brā-shūn), *n.* [L. *vibratio*, of *vibrare*, from *vibrare* (see *Vibrate*)] 1 The act of vibrating oscillation — 2 In physics, the oscillating or reciprocating motion made by a body as a pendulum a musical chord, or elastic plate, when disturbed from the position or figure of equilibrium, to recover that position or form again. When the reciprocating movement is comparatively slow, as that of the pendulum, which is produced by the action of gravity on the whole mass of the body, the term oscillation is commonly used while the term vibration is generally confined to a motion with rapid reciprocations, as that of a sonorous body, and which proceeds from the reciprocal action of the molecules of the body on each other when a disturbance takes place in their state of equilibrium. The term vibration is also applied to the alternate or reciprocating motion which is produced among the particles of a fluid or ethereal medium when their equilibrium is disturbed by any impulse, by which means waves or undulations are caused. The laws of vibratory motion form the foundation of the theories devised by modern science to account for the phenomena of acoustics and optics. See *Sound* and *Undulatory Theory of Light* under *ILLUSTRATION*. *Amplitude of vibration*, the maximum excursion or displacement of a vibrating body or particle from a position of rest. *Phase of vibrations*, a term used in reference to the vibrations of the particles of a wave of an elastic or liquid medium, which are said to be in the same phase when they are moving in the same direction.

**Vibratilis** (vī'brā'tīl-ē), *a.* A small vibration.

Hardly content of anything like he combined a deficiency in the philosophy of Locke, proposed to account for the phenomena of vibration by certain vibrations, which he supposed to take place in the ætherial system. Admitting the truth of Hardly's explanation, we get no nearer than ever to the explanation of the actual phenomena of vibration.

**Vibrionidae** (vī'brī-ōnī-dē), *a. pl.* A family or tribe of microscopic organisms, doubtfully animal abounding in decaying paste and vinegar, called microscopical ovals from their long filamentous bodies. Vibrionids occur in all infusions of animal or vegetable matter. In such infusions there appear first a thin crust or pellicle, consisting of extremely minute molecules. In a second stage these molecules appear to have increased in size by endogenous division till they form short staff shaped filaments called Bacteria. These Bacteria increase in length by the same process till they assume the form of Vibrionids, as named from the vibratile movements they exhibit. After a period they become globular and disintegrated so as to be removed back into a pellicle of fine molecules. By the advocacy of spontaneous generation or heterogeneity it is affirmed that the Vibrionids are produced spontaneously from the molecular pellicle and not from any pre-existing germs by spontaneous, on the other hand it is affirmed that they as well as Bacteria, have their origin in innumerable germs existing in the fluid or in the atmosphere, or both. Some of the Vibrionids are found in plants, some the Vibrio tricus, being parasitic in wheat, and producing the disease called ear-rot.

A member of the lowest class of unfree persons during the prevalence of the feudal system; a feudal serf. In respect to their lords or owners the *villains* had no rights, except that the lord might not kill or maim them, or ravish the females; they could acquire or hold no property against their lord's will; they were obliged to perform all the menial services he demanded; and the cottages and plots of land they occupied were held merely at his will. In respect, however, of other persons besides their lord they had the rights and privileges of freemen. *Villains* were either (a) *regardant*, or (b) *in gross*. In the former case they were annexed to the soil (*adscripti* or *adscriptitii glebæ*), belonging to a manor as fixtures, passing with it when it was conveyed or inherited; they could not be sold or transferred as persons separate from the land. In the latter case they were not affixed to a manor, but belonged personally to their lord, who could sell or transfer them at will. In this sense spelled also *Villein*. **Villénage**, **Villeinage** (vīl'en-āj), *n.* [See *VILLAIN*.] A tenure of lands and tenements by base service. It was originally founded on the servile state of the occupiers of the soil, who were allowed to hold portions of land at the will of their lord, on condition of performing base and menial services. Where the service was base in its nature, and undefined as to time and amount, the tenure received the name of *pure villénage*, but where the service, although of a base nature, was certain and defined, it was called *privileged villénage*, and sometimes *villein socage*. It frequently happened that lands held in villénage descended in uninterrupted succession from father to son, until at length the occupiers or villeins became entitled, by prescription or custom, to hold their lands against the lord so long as they performed the required services. And although the villeins themselves acquired freedom, or their land came into the possession of freemen, the villein services were still the condition of the tenure, according to the custom of the manor. These customs were preserved and evidenced by the rolls of the several courts-baron, in which they were entered, or kept on foot by the constant immemorial usage of the several manors in which the lands lay. And as such tenants had nothing to show for their estates but the entries into those rolls, or copies of them authenticated by the steward, they at last came to be called *tenants by copy of court-roll*, and their tenure a *copy-hold*.

The disease manifests itself by the development of the fungus over the leaves or shoots as well as over the berries themselves, covering the affected parts with a white powdery-looking net-work of beaded fibres. Growth is soon arrested, and decay or drying up, accompanied with an offensive smell, follows. Sulphur is said to be a reliable remedy. (b) A disease due to the invasion of the parasitic insect *Phylloxera vastatrix*, which, making its first appearance near Avignon in France in 1866, spread over in less than ten years a great part of the richest vine-growing regions of that country, almost entirely destroying the crops in several districts. When the *Phylloxera* attacks a vine the rootlets exhibit peculiar swellings, and the insects multiply so rapidly as soon to overrun all the roots, and by absorbing nourishment from the plant reduce it to a totally exhausted state. No certain remedy has as yet been discovered against this evil. Many other fungous and insect parasites attack the vine, but with far less destructive effects.

In wine countries it is obtained from the acetous fermentation of inferior wines, but in this country it is usually procured from an infusion of malt which has previously undergone the vinous fermentation. Vinegar may also be obtained from strong beer, by the fermentation of various fruits, or of a solution of sugar mixed with yeast; in short, all liquids which are capable of the vinous fermentation may be made to produce vinegar. 120 parts of water, 12 of brandy, 3 of brown sugar, 1 of tartar, and  $\frac{1}{2}$  of sour dough, if left for some weeks in a warm place, yield a strong and pleasant vinegar. All the above vinegars yield by distillation a purer and somewhat weaker acetic acid, called *distilled vinegar*.—*Radical vinegar*, a more concentrated solution of acetic acid, obtained by distilling 8 parts of dry powdered acetate of soda with 97 of oil of vitriol, as pure and concentrated as possible. This vinegar, holding camphor and essential oils in solution, constitutes the *aromatic vinegar* of the shops.—*Wood vinegar*, an impure acetic acid obtained by the distillation of wood: called also *Pyroligneous Acid*. Dier takes the word from *L. vitulari*, to be joyful, to celebrate a festival. *Fiddle* may have the same origin. See **FIDDLE**.] An ancient musical instrument of much the same form as the violin, but having the belly and back flat, and with larger bends in the sides than that instrument. It may be considered as the parent of our modern instruments of the violin kind. The viol was a stringed instrument with frets, and played on by a bow. There were three sorts, treble, tenor, and bass, each having from three to six strings, which were tuned in fourths and thirds.

the same number of metal strings, tuned in unison, were placed under the finger-board, which, by the production of sympathetic sound, gave a peculiar quality of tone to the instrument. — *Viola pomposa*, a species of *viol da gamba*, invented by Bach, having five strings, the four lower of which were tuned like the violoncello in fifths, and the fifth string was tuned to E.

The greatest favourites are the varieties of the *V. odorata*, or common sweet violet, and of *V. tricolor*, the pansy, or heart's-ease, *V. odorata* being especially esteemed for its fragrance and early appearance. The roots of several species of *Viola* were formerly used in medicine. They contain a bitter alkaloid (violon, which see), which acts as an emetic and purgative.

The order is divided into two tribes, *Violeæ* and *Alsinoidæ*. *Violeæ* chiefly consist of European, Siberian, and American plants. *Alsinoidæ* are South American and African plants. The roots of all the *Violaceæ* appear to be more or less emetic, a property which is strongly possessed by the South American species.

Viol da gamba.—From Harleian MS.

The *treble viol* was somewhat larger than our violin, and the music for it was written in the treble clef. The *tenor viol* was about the same length and breadth as the modern tenor violin, but thicker in the body, and the music for it was in the mean or C clef. The dimensions of the *bass viol* were much the same as those of the violoncello, and the music for it was written in the bass clef. The smaller viols were called *viol da braccio*, from being held by the arm, the larger, *viol da gamba*, from being placed between the legs. The *viol da gamba* held its place longer than the smaller viols, but at last gave way to the violoncello. — *Viol d'amore*, an obsolete instrument of the violin family, in addition to five or seven catgut strings,

**Violin** (vi'ô-lin), n. [It. *violino*, a dim. of  
*viola*. See **VIOL**.] A well-known stringed  
musical instrument, consisting of four cat-  
gut strings, the lowest of which is covered  
with silvered copper wire, stretched by  
means of a bridge over a hollow wooden  
body, and played with a bow; a fiddle. It  
is considered the most perfect of musical  
instruments, on account of its capabilities  
of fine tone and expression, and of produc-  
ing all the tones in any scale in perfect tune.  
It forms with its cognates, the viola, violon-  
cello, and double-bass, the main element of  
all orchestras. The principal parts of the  
violin are the scroll or head, in which are  
placed the pins for tuning the strings; the  
neck, which connects the scroll with the  
body, and to which is attached the finger-  
board, upon which the strings are stopped  
by the fingers of the left hand as it holds the  
neck in playing; the belly, over which the  
strings are stretched, and which has two  
f-shaped sound holes, one on each side; the  
back or under side; the sides or ribs, uniting  
the back and belly; the tail-piece, to which  
the strings are fastened; and the bridge.  
The four strings of the violin are tuned at  
intervals of fifths, G, A, E reckoning upwards.  
Every intermediate semitone in its ordinary  
compass of 3½ octaves may be produced by  
stopping the strings, and the compass may  
be almost indefinitely extended upwards by  
the harmonics produced by touching the  
strings lightly. The violin can, to a limited  
extent, be made to produce harmony by  
sounding two or three strings together. In-  
struments of the violin kind are of great  
antiquity.

is tuned in fifths, C (on the second ledger-line  
below the bass-staff), G, D, A reckoning up-  
wards, and is an octave lower than the viola  
or tenor violin. Its ordinary compass from

with teeth, and both jaws are feeble. The  
scales of the abdomen are bold, broad, and  
arranged like overlapping bands. The head  
is large in proportion to the neck, and very  
wide behind, so that it has been not unaptly  
compared to the ace of spades. The hinder  
limbs are not seen. The sub-order *Viperina*  
comprises two families, *Viperidæ* or vipers,

Potential. *Stillingfleet*. — *Virtual focus*, in optics, the point from which rays which have been rendered divergent by reflection or refraction appear to issue. — *Virtual velocity*, in med. the velocity which a body in equilibrium would actually acquire during the first instant of its motion, in case of the equilibrium being disturbed. The principle of virtual velocities may be thus enunciated: 'If any system of bodies or material points, urged each by any forces whatever, be in equilibrium, and there be given to the system any small motion, by virtue of which each point describes an infinitely small space, which space will represent the virtual velocity of the point, then the sum of the forces, multiplied each by the space which the point to which it is applied describes in the direction of that force, will be always equal to zero or nothing, regarding as positive the small spaces described in the direction of the forces, and as negative those described in the opposite direction.' This great prin-

ciple is easily verified by experiment with respect to the six mechanical powers, but it applies immediately and most evidently to all questions respecting equilibrium or statical problems, and it furnishes a very easy method of ascertaining the power of any machine, or the proportion between two forces which would balance one another. For according to this principle the power multiplied by the space through which it moves in the vertical direction must always be equal to the weight multiplied by the space through which it moves in the vertical direction.

In the early Vedas he appears as the manifestation of the sun, and was not regarded as the most exalted deity this rank being accorded to him by the later writers of the Râmâyana, the Mahâbhârata, and more especially of the Purânas. The Brahmanic myths relating to Vishnu are characterized by the idea that, whenever a great physical or moral disorder affected the world, Vishnu descended in a small portion of his essence to set it right. Such descents are called *avatars* or *avatars*, and consist in Vishnu's assuming the

form of some wonderful animal or superhuman being, or as being born in human form of human parents, and always endowed with miraculous power. These avatars are

generally given as ten, nine of which are already past, the tenth, the Kalki-avatars, being yet to come, "when the practices taught by the Vedas and the institutes of the law shall have ceased, and the close of the Kali or present age shall be nigh."

Vishnu is sometimes represented as riding on Garuda, a being half bird and half man; as holding in one of his four hands a conch-shell blown in battle, in another a disc, an emblem of supreme power, in the third a mace as the emblem of punishment; and in the fourth a lotus as a type of creative power.

In opposition to the popular theory that we actually see the externality and solidity of the objects around us, Dr. Berkeley maintains that these properties are not the immediate objects of sight at all, but are simply ideas derived originally from the touch and movement, being erroneously attributed to vision from their having been uniformly experienced concurrently with certain visible signs (such as colour) with which the sense of sight is solely and truly conversant. — 3 That which is seen, an object of sight. — 4 That which is seen by the eye of the mind or imagination, something supposed to be seen otherwise than by the ordinary organs of sight, a supernatural, prophetic, or imaginary appearance; something seen in a dream, ecstasy, trance, or the like, an apparition, a phantom.

The best known, and by far the most important species, is the *V. vinifera*, the common vine or grapevine, a native of Central Asia, of which there is a multitude of varieties. The cultivation of the vine extends from near 55° north latitude to the equator, but in south latitudes it only extends to about 40°. It is rarely grown at a greater altitude than 3000 feet. In favourable seasons the vine ripens in the open air in England, and in the eleventh and twelfth centuries considerable quantities of inferior wine were made from native grapes. Vineyards are now, however, unknown in this country; but the grapes raised in hothouses are excellent. The vine grows in every sort of soil; but that which is light and gravelly seems best suited for the production of fine wines. The vine is a long-lived plant; indeed, in warm climates, the period of its existence is not known. It is propagated from seeds, layers, cuttings, grafting, and by inoculation. Several species of vine are indigenous in North America, as the *Vitis Labrusca*, the wild-vine or fox-grape; *V. cordifolia*, heart-leaved vine or chicken-grape; *V. riparia*, river-side or sweet-scented vine. creature, whether man or animal, especially, human utterance in speaking, singing, or otherwise, the sound made when a person speaks or sings, mode or character of sounds uttered; as, to hear a voice; to recognize a person's voice; a loud voice; a low tone of voice; 'a man's voice,' 'didst utter forth a voice'; 'the voice of a nightingale.' *Shak.*

**Voice** as a scientific term may mean either the faculty of uttering audible sounds, or the body of audible sounds produced by the organs of respiration, especially the larynx of men and other animals: contradistinguished from speech or articulate language. Voice is produced when air is driven by the muscles of expiration from the lungs through the trachea and strikes against the two vocal chords (see under **Vocal**), the vibrations of which produce sounds varying in different animals according to the structure of the organs and the power which the animal possesses over them. Voice can, therefore, only be found in animals in which the system of respiration is developed, and the lungs and larynx actually exist. Fishes having no lungs are dumb. In man the superior organization and mobility of the tongue and lips, as well as the perfection of the larynx, enable him to modify his vocal sounds to an almost infinite extent. In ordinary speaking the notes of the voice have nearly all the same pitch, and the variety of the sounds is due rather to articulation in the mouth than to definite movements of the glottis and vocal chords. In singing the successive sounds have vibrations corresponding in relative proportions to the notes of the musical scale. The male voice admits of division into tenor and bass, and the female into soprano and contralto. The lowest female note is an octave or so higher than the lowest note of the male voice; and the female's highest note is about an octave above that of the male. The compass of both voices taken together is about four octaves, the chief difference resulting in the pitch and also in the timbre. 2. The faculty of speaking; as, to lose one's voice. — 3. A sound produced by an inanimate object and regarded as representing the voice of an intelligent being, sound emitted, as, the voice of the winds. 'The trumpet's voice.' *Aldrich.*

But *b* differs from *p* in so far as, in order to pronounce it, the breath must have been changed by the glottis into breath. *Max Müller.*

2. Having the quality of passing off by spontaneous evaporation, evaporating rapidly, diffusing more or less freely in the atmosphere. Substances which affect the smell with pungent or fragrant odours, as musk, harts-horn, and essential oils, are called volatile substances because they waste away on exposure to the atmosphere. Alcohol and ether are called volatile liquids for a similar reason, and because they easily pass into the state of vapour on the application of heat. On the contrary gold is a fixed substance because it does not suffer waste, even when exposed to the heat of a furnace, and oils are called fixed when they do not evaporate on simple exposure to the atmosphere. See OIL. — 3. Lively, brisk, gay; full of spirit, airy, hence, scible, apt to change, as, a volatile temper.

Skr. vâh, fire.] A hill or mountain more or less perfectly cone-shaped, with a circular cup-like opening or basin (called a crater) at its summit; popularly termed a burning mountain. In the centre of the crater is the mouth of a perpendicular shaft, which sends out clouds of hot vapour, gases, and, at times of increased activity, showers of ashes, hot fragments of rocks, and streams of fiery liquid rocks, called lava, which flow down the slopes of the mountain. The gradual accumulation of these ejected materials

Section of an active Volcano.

around the crater forms a succession of concentric layers which explains the conical shape. The mountain has often several subsidiary cones connected with the principal, and lava may flow out from various mouths or vents. The flames described as issuing from the crater are usually the reflection of the glowing lava illuminating the clouds of vapour, scorin, and ashes. Nearly all active volcanoes have times of relative repose, interrupted, often at great intervals, by periods of increased activity, which terminate in a violent ejection of incandescent matter from the interior. The volcano is then said to be in a state of eruption, which is usually foreboded by loud subterranean noises, like explosions of distant artillery, shocks of earthquake, &c. The most important European volcanoes are Vesuvius, near Naples, whose sudden eruption in 79 A.D. overwhelmed Pompeii, Herculaneum, and other cities. Etna, in the island of Sicily; and Hecla in Iceland.

A volcano has been described by Sir Charles Lyell as a more or less perfectly conical hill or mountain, formed by the successive accumulations of ejected matter in a state of incandescence or high heat, and having one or more channels of communication with the surface of the earth, by which the ejections are effected. *Page.*

**Vole** (vôl), n. (Also called vole-mouse, perhaps for vole-mouse, wild, field, plain, so that the name would be equivalent to field-mouse, comp. O. Southern E. vole, field, earth, Ital. volle, field.) A name common to the members of a widely spread genus (Arvicolæ) of rodent animals, resembling, and in many cases popularly bearing the names of rats and mice, and belonging to a group (Arvicolidae) which some naturalists regard as a distinct family, others as a sub-family of the Muridae. Some are terrestrial, others aquatic. The common vole (*A. agrovæus*), the meadow-mouse or short-tailed field-mouse, is injurious to young plantations, devouring the bark and destroying the roots. The water-vole or water-rat (*A. amphibæus*) is much larger, and swims well though its feet are not webbed. A black variety of the water-vole common in Britain is the *A. atra*. There are many other species in the Old and New Worlds. See ARVICOLA.

'Will' is an ambiguous word, being sometimes put for the faculty of willing, sometimes for the act of that faculty, besides other meanings. But volition always signifies the act of willing, and nothing else. Williness, I think, is opposed to unwillingness or aversion. A man is willing to do what he is unwilling to do, or what he has some desire to do, though perhaps he has not the opportunity, and I think this is never called volition. *Land.*

A very simple volumenometer consists of a globular flask with a narrow neck, about 12 inches long, and graduated from below upwards to indicate grains of water. The flask has a tubulure, accurately fitted with a ground stopper, for admitting the solid body to be measured. The instrument being filled to the mark 'o' on the neck with a liquid, as water, which does not act upon the solid, it is inclined on one side, the stopper removed, and the solid body introduced. The stopper is then replaced, and the number of divisions through which the liquid is raised in the stem gives at once the volume of the body in grain-measures. *Watts' Dict. of Chem.*

In 1794, and again in 1803, when the ambition and threats of France agitated England, the government reckoned upon having a force of half a million efficient volunteers in arms; but by 1815 this force almost ceased to exist. About 1857 a feeling of insecurity began to manifest itself in consequence of the alleged insufficiency of the national defences, and several volunteer corps were formed. In the course of two or three years many thousands of volunteer riflemen were enrolled throughout the kingdom. Corps of artil-

lerymen, engineers, &c., were subsequently formed. These bodies of men the British government provides with competent instructors, arms, and a part of their ammunition, besides allowing to each corps certain grants calculated on the number of the efficient members, &c.
